                                                        EUT. J. Biochem. 175:525-530(1988).
-1- FUNCTION: NUCLEDIAN IS THE MAJOR NUCLEDLAR PROTEIN OF GROWING EUKARYOTIC CELLS. IT IS FOUND ASSOCIATED WITH INTRANUCLEDIAR CHROMATIN AND PRENIBOSOMAL PARTICLES. IT INDUCES CHROMATIN DECONDENSATION BY BINDING TO HISTONE HI. IT IS THOUGHT TO PLAY ROLE IN PRE-RRNA TRANSCRIPTION AND RIBOSOME ASSEMBLY.

"Neurofilament M mRNA is expressed in conduction system myocytes of
the developing and adult rabbit heart.";
J. Mol. Cell. Cardiol. 28:1833-184(1996).
-1- FUNCTION: NEUROFILAMENTS USUALLY CONTAIN THREE IF PROTEINS: L, M,
AND H WHICH ARE INVOLVED IN THE MAINTENANCE OF NEURONAL CALIBER.
-1- PTM: THERE ARE A NUMBER OF REPEATS OF THE TRIPEPTIDE K-S-P, NFM IS
PHOSPHORYLATED ON A NUMBER OF THE SERINES IN THIS MOTIF. 1T IS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    THOUGHT THAT PHOSPHORYLATION OF NEH RESULTS IN THE FORMATION OF INTERFILLAMENT CROSS BRIDGES THAT ARE IMPORTANT IN THE MAINTENANCE OF AXONAL CALIBER.

PTM: PHOSPHORYLATION SEEMS TO PLAY A MAJOR ROLE IN THE FUNCTIONING OF THE LARGER NEUROFILLAMENT POLYPEPTIDES (NF-M AND NF-H), THE LEVELS OF PHOSPHORYLATION BEING ALTERED DEVELOPMENTALLY AND COINCIDENT WITH A CHANGE IN THE NEUROFILLAMENT FUNCTION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the European Bioinformatics Institute. -1- FUNCTION: NUCLEOLIN IS THE MAJOR NUCLEOLAR PROTEIN OF GROWING EUKARYOTIC CELLS. IT IS FOUND ASSOCIATED WITH INTRANOCLEOLAR CHROMATIN AND PRERIBOSOMAL PARTICLES. IT INDUCES CHROMATIN DECONDENSATION BY BINDING TO HISTONE HI. IT IS THOUGHT TO PLAY A ROLE IN PRE-RRNA TRANSCRIPTION AND RIBOSOME ASSEMBLY.
